A simple thermographic model has been developed that accurately describes the surface temperature response of an aluminum panel with flat bottom holes of different depths and diameters to a short heat pulse. This model assumed that a thin layer of material at the surface is instantaneously heated by the pulse, and that subsequent cooling of the surface is due to diffusion of the deposited energy into the bulk of the material. The model accounts for sample thickness, density, specific heat, in-plane and out-of-plane thermal conductivity and defect size and depth. However, heat pulse parameters such as pulse duration and intensity were not included. In this talk we will present experimental and modeling results on graphite epoxy composites with flat bottom holes of different radii and depth. The experimental results were collected with standard pulse thermographic equipment. The experimental data was analyzed with our model. The effects of anisotropy in the thermal conductivity will be presented and discussed.

## CONTRAST PROPERTIES

$$\Delta T = \frac{Q}{\rho \cdot c} \left( \frac{1}{d} - \frac{1}{t} \right)$$

1. THE CONTRAST ( $\Delta T$ ) INCREASES LINEARLY WITH THE AMOUNT OF DEPOSITED ENERGY PER UNIT AREA ( $Q$ ).
2. THE HIGHER THE SPECIFIC HEAT-DENSITY OF A MATERIAL ( $\rho c \uparrow$ ) THE SMALLER THE PEAK CONTRAST ( $\Delta T \downarrow$ )
3. THE CLOSER THE DEFECT TO THE SURFACE ( $d \rightarrow 0$ ) THE HIGHER THE PEAK CONTRAST ( $\Delta T \rightarrow \infty$ ).
4. AS THE DEFECT DEPTH APPROACHES THE PANEL THICKNESS ( $d \rightarrow t$ ) THE CONTRAST VANISHES ( $\Delta T \rightarrow 0$ ).
5. FOR A GIVEN DEFECT DEPTH  $D$ , THE THICKER THE PANEL ( $t \rightarrow \infty$ ) THE LARGER THE CONTRAST ( $\Delta T \rightarrow Q/\rho c d$ ).

## MODEL ASSUMPTIONS

- THE ENERGY "Q" IS ABSORBED BY A THIN LAYER OF THICKNESS "p". THE EXPRESSIONS DERIVED IN THIS WORK ARE DERIVED IN THE LIMIT WHEN " $p \rightarrow 0$ "
- NO ENERGY IS DISSIPATED RADIATIVELY OR CONVECTIVELY TO THE SURROUNDING ENVIRONMENT
- THE CONDUCTANCE "K" BETWEEN ELEMENTS CAN HAVE BEEN EXPRESSED AS " $K = k A/l$ ". THE LATERAL AND NORMAL CONDUCTIVITIES ARE ASSUMED TO BE DIFFERENT

# LATERAL HEAT FLOW EFFECTS (effective contact conductivity model)

## SUMMARY AND CONCLUSIONS

- Calorimetric model was developed to predict thermal contrast.
- Model accounts for defect size, location, and lateral conductivity effects.
- Calorimetric model correlates well with experimental results.
- Anisotropic thermal conductivity can be modeled.
- Model accuracy should improve as the element mesh is refined.
